- Air / Ocean
- Supply Chain Optimization / Modeling

Bonded Transportation, the freight brokerage division of 3PL Bonded Logistics, combines asset and non-asset based transportation experience, a robust carrier network, and a powerful transportation management system to provide flexible freight solutions that help our clients maximize savings and improve transit time.

With over 35 years of combined brokerage expertise in the transportation industry, Bonded Transportation builds partnerships with our clients, understanding their unique shipping challenges and transportation requirements. We maintain a reliable and versatile network of certified carriers to accommodate all transportation modes and reach global destinations. Our industry leading transportation management system (TMS) provides visibility of shipments, optimization and reporting capabilities, and includes an intuitive web portal for clients and carriers. We can maximize savings by leveraging the total volume of freight across Bonded's entire logistics network. Shippers today need a transportation partner that is flexible and can maintain their vision. Let us show you how we get that done.

TRUCKLOAD

Seamless transportation via truckload is a requirement, and Bonded Transportation knows how to get it done. Our certified carrier network provides coverage across the United States and Canada. We have access to a wide variety of transportation options, including straight trucks, fifty-three footers, reefers, and flat beds. An experienced customer service team ensures clean, modern, and safe truckload trailers are assigned exclusively to your freight. We also provide dedicated delivery options through customized programs for clients looking to move freight across North Carolina and South Carolina.

LTL

Timely and safe arrival of your less-than-truckload (LTL) freight is our top priority. We work directly with our LTL partners to maintain highly competitive rates along with outstanding service and support. Our network of national and regional carriers ensures successful transportation and documentation of your LTL shipments. We leverage the volume of freight across our entire transportation network and negotiate accessorial charges like lift-gates and inside delivery. Bonded Transportation also works with our LTL carriers to create customized programs to fit our client's needs.

INTERMODAL / RAIL

Our intermodal service allows for less handling of your freight and offers a great potential for cost savings. The Bonded Transportation Team can provide intermodal support to your business from multiple inland and coastal ports. We've established partnerships with intermodal carriers along with the railroad companies to ensure safe transportation of your goods across the country.

DRAYAGE

When you need goods transferred via the port or rail head, Bonded Transportation has got you covered. We have established a network of certified drayage carriers that meet both port and rail qualifications. This allows our team to easily coordinate your freight to/from ports and rail centers to one of our facilities or to your customer's site. This includes Inland ports as well as coastal ports, including Coast-to-Coast drayage needs to get from port to destination.

EXPEDITED

Bonded Transportation offers time-sensitive transportation and emergency shipments through our expedited services. Working with our certified carriers, we are able to manage and move freight quickly via land or air to ensure on-time delivery. We make all arrangements - from origin to delivery – and ensure signature confirmation when necessary.

AIR / OCEAN

Our certified carriers and freight forwarders can easily manage your air/ocean cargo and customs needs. Bonded Transportation can assist with document preparation, shipment entry, and required customs clearance to meet your delivery requirements. Other air/ocean services we can initiate include managing your ocean-import and export containers, ocean freight, and drayage.

SUPPLY CHAIN OPTIMIZATION / MODELING

Bonded Transportation provides supply chain optimization and modeling solutions by integrating our industry experience, state-of-the-art TMS software, and data analytics tools. This helps our clients create accurate models of their end-to-end operations, identifying major improvements in the supply chain, generating reductions in freight costs, and increasing overall service levels.
